```

When comparing the convergence of posterior parameters of both the data sets with $\phi = 0.3$ and 0.95 , the

dataset with generated with $\phi = 0.95$ has started to converge lately with some initial burning period. The uncertainty of the μ is also high in second dataset. Hence data set with $\phi 0.3$ has better convergence than data set generated with $\phi 0.95$.

Comparing the plots of 1c with 1d and after emphasising more on sigma, the Posterior Latent Intensity better fits the data with wider Credible Intervals.
